**SPECIALLY DESIGNED
PALLECON OUTLET MAGNET
MANUFACTURED BY
MAGNATTACK™ GLOBAL FOR
METAL FRAGMENT CONTROL**

Liquid ingredients can be often the cause of introduction of metal fragments into food products. MAGNATTACK™ GLOBAL has developed a magnetic separating device designed for the outlet of palletcon containers in the food and beverage industry which enables metal fragment control over of raw incoming liquid ingredients.

The MAGNATTACK™ RE80 palletcon outlet magnet simply screws into the 2" valve or socket and is designed to extract small magnetic particles and fragments from liquid ingredients using certificated 10,000 gauss magnetic element.

Use of the palletcon outlet magnet ensures stainless steel, magnetic stone, rust fragments etc. are extracted before liquid ingredients are added to mixing or blending operations. The palletcon outlet magnet also provides a control on the quality of raw material suppliers. A 10,000 gauss pole band is arranged on the bottom of the flow to ensure that the nastiest of metal fragments or wires score a direct hit to the most powerful part of the magnet. The design of the palletcon magnet also ensures highest percentage retention of such fragments on the magnet until the magnet is cleaned.
